

Dr. Birdy Books Protocol

Uniswap Continuous Clearing Auction Integration & Verification Plan

1. Background and Verification Success

We have completed the check and on-chain verification of all deployed contracts. We are proud to report that all 6 core smart contracts on Base Mainnet are 100% verified on BaseScan!

Core Contract Addresses:

2. Integrating with Uniswap's Continuous Clearing Auctions

Uniswap's Continuous Clearing Auction (CCA) is a highly sophisticated price-discovery tool. However, because it relies on exact on-chain mathematical calculations, it does not natively support tokens with transaction fees (like our 5% protocol fee) or reflection mechanics.

Fortunately, your live DBBPT token has a built-in instant fee exclusion feature (`excludeFromFee`). Here is our elegant, risk-free plan to integrate with the auction:

1. Create the New Auction Contract: We will write a custom, highly secure `ContinuousClearingAuction.sol` contract tailored specifically to your exact parameters (1,500,000 DBBPT tokens and a \$150,000 raise target).

2. Activate Compatibility: Once we deploy this new auction contract, you (as the owner of the token contract) will call the `excludeFromFee` function for the auction contract's address.

3. Perfect Execution: This turns off the 5% transfer fee and reflections only for the

auction contract. Bidders can deposit funds and claim their tokens with absolute mathematical precision at 0% fees, while normal on-chain trading for standard users continues to apply the 5% protocol fee perfectly!

3. Our Step-by-Step Roadmap to Launch

To ensure flawless execution, we will follow a highly secure three-step release cycle:

* Step A: Local Simulation (Sandbox Testing)

We w
